

Ideas	Attrs
Bush fires	Individual shapes Time Area Perimeter State Count
Cyclones	Eye pressure Lat/lon Name Time
Insurance	Claim \$ Type State(s) Name Year

Can any views be combined?
Is the trend over time clear?
Is the affects of each disaster clear?
How much aggregation and filtering is needed?
Cyclones can get very busy.

Too aggregated?
Filter by year?
Zoom for detail?
Bush fires too spread out?

+ Natural embedding
+ can use fire related colours

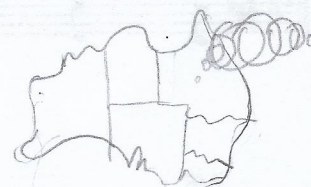

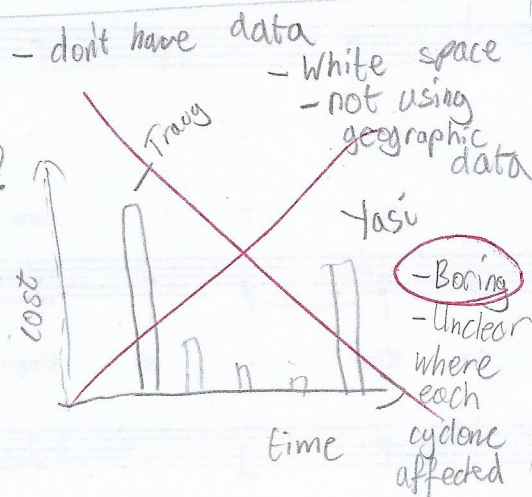

- Scale not great
- smallest state has large value
- overlap?
- white space?

- May imply one big fire / fire breaches state line

+ Clear use of data
- Lack direction?
- Overlapping
→ filter

- Cyclones affects not clear?
+ Can overlap with other map.

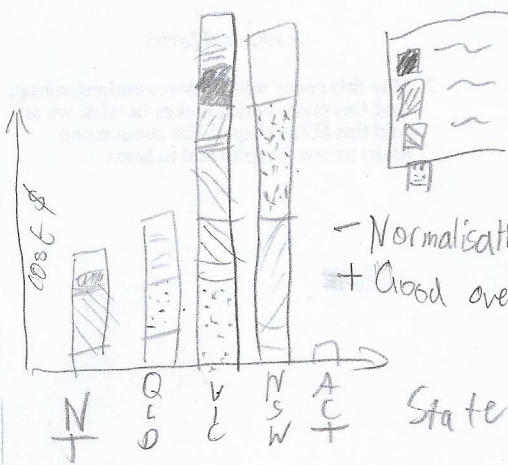

+ clear extent of affected areas
- overlap / space?
Need aggressive filtering
- Mapping size accurately is hard
- Assumes sized damage.

Insurance

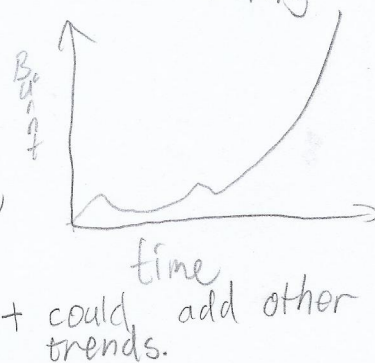

Proportional symbol map for each disaster + state

- Way too busy.
- Can't compare easily.
- Scale and overlap issues
- Something else would be better use of map.

- Normalisation
+ Good overview

Bush fires + Simple
- Boring

Sheet 2 Sean Silva

Focus

Can Combine choropleth for bush fires and traces for cyclones and dots for other disasters onto one map.

Show only the most impactful events and use surrounding text to explain shown events.

The cyclones could also have their name some annotated on its trail.

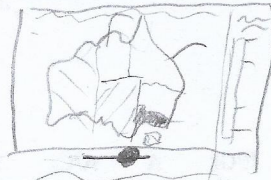

Operation

The Slider on the map allows users to filter which time period of floods + cyclones are shown and what aggregated time period is shown on the choropleth.

This also lets the user see the trend of bushfire burnt area over time.

This filtering allows more data to be shown on the map

Title

Layout

Summary

Pro

Clear linear story telling
Map is clear and central

Con

Lots of white space
~50% width

Does not Follow

Overview → Focus

Line & Bar → Map

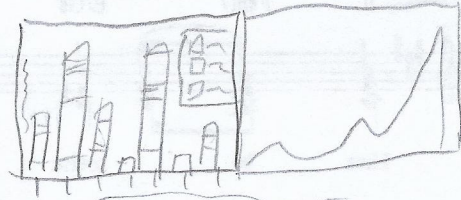

long lines of text

Sheet 3 Sean Silva

Focus

The Stacked bar chart shows a strong overview of which events each state regularly receive, and which are more costly. This allows the user to use the map to filter down to the region of interest.

Title

Boundary
to frame
main
content

Layout

Operation - Tooltips

Hovering the symbols/areas of the map will show tooltips that give exact values, and meta data of point eg. name / damages (\$) time, area burnt.

For the stacked bar it will show the name of the event so users can see which events were most damaging, as well as total insurance claimed as the y values have to be normalised by population.

Pro

uses space well, little white space

Has Background layer

side by side charts compact
maybe misleading as unrelated

Con

Symbol map has overlap
long lines of text?
hard to talk about top charts individually.

Sheet 4 Sean Silva

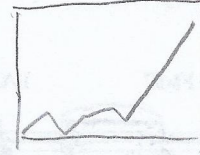

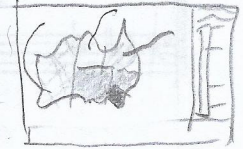

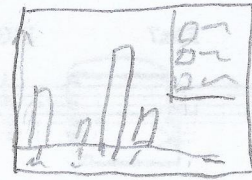

Focus Layout

The layout of the charts is a little unorthodox, which may help to engage the user.

This also naturally limits the line sizes so lines aren't too long.

The zig zag also breaks symmetry, so the charts don't have to be the exact same width, and there are still clear sections.

Title

Layout

Operation Scrolling

Each of the sections with their chart should consume ~ full screen height. This gives good framing.

To see the remaining content the user can scroll when they are ready.

This will feel like page turning in a book and add to story telling aspects.

Pro

Short line lengths.

Interesting sight line
Overview → Focus

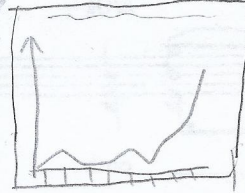

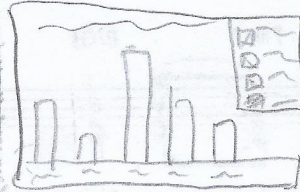

Con

Sight line is confusing?

Sheet 5 Sean Silva

Taken sheet's 4 design
As this sheet has best
layout for story telling and
overview before focus

Australia's Ravaged States

Focus

Operation

Users can scroll the webpage to see each chart which on their own should fill the whole screen.

For the map there should be a filter parameter for the bushfire choropleth and cyclone & flood dot map to reduce clutter and investigate specific time periods.

Details

How to aggregate choropleth data?

Where to source flood data?

I only have 3 hours left so maybe ignore flood map data.

The story telling text has not been assessed yet, this needs thought.
